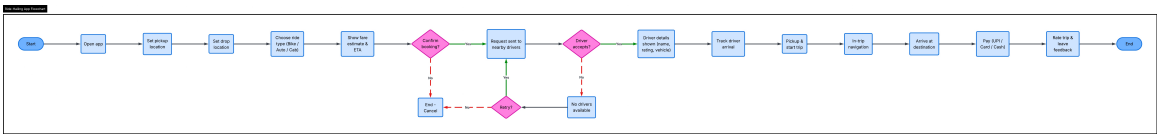
Flowchart Explanation



This flowchart depicts a standard software development process, likely representing an experiment or lab exercise (exp5) on flowcharting or process modeling. It uses standard flowchart symbols:

- Oval shapes (terminators): Start and End points of the process.

- Rectangular shapes (processes): Individual steps or actions.

- Diamond shapes (decision points): Points where a decision is made, leading to yes/no branches.

- Arrows: Directional flow of the process.

Detailed step-by-step breakdown from left to right:

1. START: Initiation of the process.

2. First process box: Likely 'Read input data' or 'Initialize variables' (text not fully legible).

3. Second process: Possibly 'Process data' or 'Calculate something'.

4. Decision diamond (pink): A condition check, e.g., 'Is condition true?'.

- Yes branch goes down to another process.

- No branch loops back or continues.

5. Following processes: Sequential steps like 'Display result', 'Validate input', etc.

6. Another decision: Further branching logic.

7. Multiple parallel or sequential paths merging back.

8. END: Termination.

The linear main flow with two decision branches (one looping back) suggests an algorithm with loops or conditional repetitions, such as a simple loop with a condition (e.g., do-while like structure for input validation or iteration until condition met).

This structure is common in programming experiments for demonstrating control flow: sequence, selection (if-else), and iteration (loops). The pink diamonds highlight decision points for emphasis.
